software Many computing and networking platforms require power and/or communication cables to extend throughout their premises. These platforms often include networking equipment and/or computing equipment that is disposed in a rack or a cabinet. For example, large banks of equipment may be placed in a rack or cabinet in a network center. Many racks and cabinets have a front door that may be opened to provide access to the interior of the rack or cabinet. Racks and cabinets are often placed in an open environment, such as a room, with a front door open. These types of environments have little or no security. The interiors of the racks and cabinets have openings or openings through walls. To prevent access to the interior, conventional door stops have been placed in these openings. In some embodiments, these door stops have included a strip or pad having a pair of rigid arms. The arms each have a hook that extends outward from the strip to engage a vertical wall. The strip may be placed in an opening of a rack or cabinet. The arms of the strip are allowed to be freely pivoted about an axis in order to easily permit the user to move the strip into and out of the opening. In other embodiments, the strip may include two arms, wherein one arm may have a tip, and the other arm may be substantially perpendicular to the first arm and may be used to engage the wall. The doors of the racks and cabinets are often connected to the rack or cabinet by hinges or other similar connection devices. These door may be opened to permit access to the interior of the rack or cabinet. In many cases, the doors may be opened to permit a user to access a rear of the rack or cabinet and/or to provide for movement of computing and/or networking equipment or other items. In some instances, the doors are opened by hand. In other instances, the doors may be opened by motor-driven systems. In some instances, the door may be further opened by a latching system. For example, some racks or cabinets are equipped with a latching system for holding the door in a fully closed position, such as a door closer. In many circumstances, it may be desirable to cover or conceal the connection devices and/or doors of a rack or cabinet. For example, when a door is open, the connection devices and/or doors may be visible. Also, doors on many racks and cabinets have a trimming of the door around the f988f36e3a
