As with all applications and OS updates, security is always a concern. Lightroom does an excellent job of checking for a new version using the current with CS6. The new version is downloaded and subsequently burned into your computer's memory. If you use the same computer to open previous versions of Lightroom, it will throw an error when attempting to open a previous version. When you quit Lightroom, it prompts you to ensure that you've removed the data from the cache. Adobe's main problem is a lack of options to improve the user experience. Indeed, there are a number of features that have strayed from the original design. It's incredible that it's possible to add metallics, lens corrections, lens distortions, film grain, and desaturation to an RGB image in Lightroom but not to an HDRI. The interface for working with filters is somewhat clunky, explaining why some of them are often closed down. Yes, there are many creative filters available in Lightroom, but many of them are only for flat, color-only images. Namely, you may not have any creative filters available for HDR files. When Lightroom is offline, you can't extract any metadata from a PSD; you must do that in the original editor itself. And it is too easy to get locked out of a project when you have comments in PSD format with the same account. Commercial desktop applications are notorious for their poor management skills. Adobe is certainly not exempt from this. Unduly complicated software rarely lives up to its promise. In fact, Lightroom is a good example: it is not that different from some of the other editing software. The fact that it is an Adobe product is rather irrelevant.
