In the latest update, Adobe seems to have addressed some of the problems encountered by extreme users. For instance, the problems some people had with the Lens Correction tool in particular were supposedly fixed, and there is now a "Magnify" view in all the view modes except Examination. The Lens Correction tool now has a magnifying lens, and makes it much simpler to correct any problems with distortion and out-of-focus light.In short, I found the problems to be pretty small.

But the biggest surprise is how considerably faster the editing software works. Those who edit fast photos will probably find this about as welcome as too much air in a balloon.

Looking back at my Lightroom performance review, I would say that the most substantial changes are related to output speed, specifically the speed with which you can import, export, and view images. Adobe states on its photoshop.com website that Lightroom 6 is twice as fast as Lightroom 5 in terms of exporting images.

I never personally experienced such a dramatic improvement while exporting or importing, but I presume Lightroom imports files twice faster now because it can make more optimal use of the available resources on my machine. I spent a week testing both Lightroom 5 and the new version of Photoshop and have yet to notice any major speed differences in the rest of the application. The only times I noticed "speed improvements" in Photoshop were with sliders and rubber band tools. All the editing and cropping is completely seamless, and the experience is smoother in Lightroom. I use the "Undo" command a lot. I never thought I would be able to use its starburst effect so much, and move across the screen easily. The copying/removing of pixels is another one of those new capabilities of Photoshop's that I never noticed before. I can and will keep trying to find speed advantages in other days when I'm using the software. I assume Adobe took advantage of the faster computer environment.

The Elements' printing and imaging module has been developed with the intention that designers can output high-quality prints without having to leave the desktop. Seven new features have been included to simplify the photoshopping process:

- Design: Make a simple artistic mark for your photo using a wide variety of free pattern brushes, gradients, and strokes for various purposes—such as a moustache, a watermark, or one of the many cheesy cartoon-like hats.
- Enhance: Enhance your photo using Basic and advanced sharpening adjustments. Choose from more than 100 presets on this tab, as well as using spot healing and the adjustments to correct lens distortion, buldging, and perspective distortion.
- Elements, patterns, and textures: Use a selection of found and photographed textures to enhance your photo. The Elements module allows you to input scanned images, patterns, and textures into your layered file. Use the menu tab to select what type of content you want to include.
- Filters: Use the filter function to make text and images look like they are transmitted through television, create artistic filters, or lighten or darken your image. Apply one of more than 35 presets.
- In-place corrections: Enlarge or reduce specific areas of your photo to change its proportions. Drag any photo or selection to in-place exposure, contrast, high-key, and desaturation options.
- Red eye: Use this filter to remove red-eye from faces by pausing while you target the area of the eye with a brush. You can experiment with various settings, such as under and over saturation, to control how drastic the change is.
- Smart object: Enhance a part of your photo without affecting the rest of the photo. An example would be to enhance the subject of a landscape photo while keeping the sky and landscape in tact. This new feature is added on the **Layers** tab in the **Edit** menus.
